You said:

so what completely forget/delete about python requests and it's captures and repeat_python_requests.pcap and consider only curl is present

Worked for 28s

Memory updated

ChatGPT said:

You said:

working perfect now, see we can distinguish here but still we can do spoofing know so we even can't observe which client it may be GnuTLS but our database can show chrome know,this is limitation know?,this is what we have to write in limitations in report know

ChatGPT said:

You said:

let's do one spoofing scenrario,let's make an easy spoofing scenario ,i don't know but let's use curl and but our identify.py should report it as another onw say Gnu/openssl/.. anyone

Final Project Repor...
PDF

this is the template,see all your design and history and current implememtation ,according prepare the report
this is the Project Description: "Build a tool that passively captures TLS ClientHello and ServerHello messages and computes JA3/JA3S fingerprints (with JA4/JA4S as a stretch goal) to identify the client or server application/library generating the traffic. Curate a small reference database and demonstrate distinguishing real clients (browsers, curl, custom scripts) purely from their handshake fingerprint.
Tools/Technologies: : libpcap/Scapy (or raw sockets) for capture; fingerprint computation implemented per the JA3/JA4 specifications, eBPF/XDP, Packet/Flow Generators like TRex, KV-stores (Redis, Valkey).
Expected Outcome: Demonstrate the working JA3/JA3S fingerprint extractor, validated against published reference JA3 hashes for known clients; A curated database correctly identifying at least 5 distinct clients/tools by fingerprint alone. Demonstrate distinguishing, e.g., curl vs. a browser vs. a custom TLS client on the wire.
Understanding on the fingerprinting's role in security monitoring (malware C2 detection, client identification) and its limitations, including fingerprint randomization in modern browsers as an evasion technique." just for reference

Each team gets **15 minutes total**, which you may split between presentation and demo as you see fit. + 5 minutes Q&A.

Everyone should follow this Presentation Structure. For Those teams who have already submitted create a different ppt file & upload dont edit the exsting one.

Slide structure (5 slides): May extend one slide

1. **Problem Statement & Objectives**
2. **Architecture / Mechanism** — your design and how it works
3. **Extension / Issues Fixed / Evaluation** — what you built on top, bugs resolved, and results
4. **Non-Functional Testing Parameters** — performance, scalability, reliability, etc.
5. **Challenges Faced**

these are presentation guidelines
